

# WINDSHIELD SKIN® SUPER STRETCH

## Installation Instructions

**Important:** Please read these instructions before attempting installation.

**Items Required for Installation:** Application squeegee, anti-scratch cleaning pads, windshield-safe scraper, spray bottle, baby shampoo, distilled water, and lint-free paper towel.

## Preparation:

1

**Slip solution** - 3mls baby shampoo to 32oz spray bottle filled with distilled water

Tip: For best results, water should be lukewarm.

2

Clean the surface of the windshield thoroughly using the slip solution and windshield-safe scraper. Then clean with the slip solution and scrub pad. Finally clean with the slip solution and squeegee.

## Installation:

**Note:** Using the slip solution, spray your fingers clean to keep them wet during the installation process. Handling the adhesive with dry fingers will leave visible marks.

3

Lay the material on the windshield and trim it to an outline slightly larger than the windshield. Pull off the protective cap sheet. You will make an exact cut later in the installation process.

4

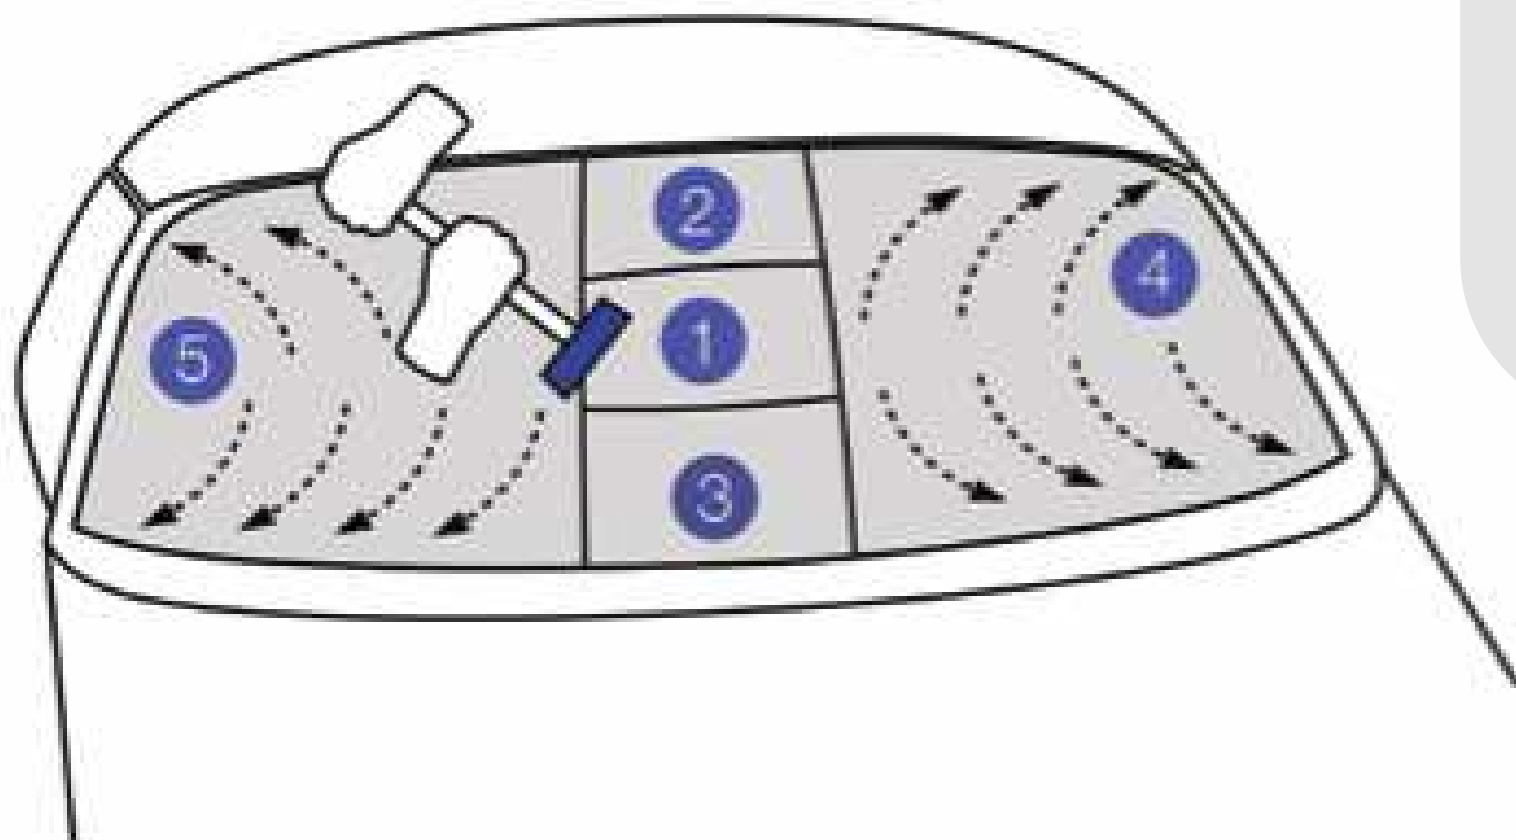

Have the material liner facing up and carefully remove the liner. Generously spray slip solution onto adhesive side while pulling away the liner. **LEAVE NO DRY AREAS!** Be cautious not to crease the material.

5

Spray the windshield generously and apply Windshield Skin® onto the windshield.  
Note: Slip solution allows the material to move on the windshield to the desired position. Respray if needed.

6

Once in position, wet the top of the material and with the squeegee, use long firm strokes to force excess slip solution and air bubbles out to the edges of the Windshield Skin®. Start with section 1 (seen to the left) to lock the material into place. The videos show that we suggest to swipe horizontally on section 1, and vertically on sections 2 and 3. Follow motions for sections 4 and 5. Now trim the excess material on the edges.

**Note:** Once you squeegee the material onto the windshield, you cannot lift and reapply it again.
